

1) originally 4 sheets

$\sqrt{1}$
 Given: ϵ, σ
 Find: w, f ?
 Solution: $w = \frac{\epsilon E^2}{8\pi}$

$E = \frac{4\pi\sigma}{\epsilon} \Rightarrow w = \frac{\epsilon \cdot 16\pi^2\sigma^2}{8\pi \cdot \epsilon^2} = \frac{2\pi\sigma^2}{\epsilon}$
 (on glass maximum)

$f = \frac{F}{S}$ (no glue); $F = qE = \sigma S \cdot 2\pi\sigma \Rightarrow$

$\Rightarrow f = \frac{2\pi\sigma^2 S}{S} = 2\pi\sigma^2$

Problem: $w = \frac{2\pi\sigma^2}{\epsilon}$; $f = 2\pi\sigma^2$

$\sqrt{2}$
 Given: $C = 20 \mu\text{m}; \epsilon = 2$
 Find: R ?
 Solution: $R = \rho \frac{l}{S}$; $\rho = \frac{1}{\sigma}$

$\lambda = 10^{-6} (\text{m})$
 $C = \frac{\epsilon S}{4\pi\lambda l} \Rightarrow \frac{l}{S} = \frac{\epsilon}{4\pi C \lambda}$
 $R = \frac{\epsilon}{4\pi C \lambda} =$

$= \frac{2}{4 \cdot 3.14 \cdot 20 \cdot 10^{-6}} \approx 8 \text{ k}\Omega$

Problem: $8 \text{ k}\Omega$

$\sqrt{3.50}$

Given:
 R, Q

 $P?$

Potential

$W_B \approx 0$ because
 in center

$$dW = (w_2 - w_1) dV \Rightarrow P = |w_2 - w_1|$$

$$A = P dV$$

$$W_A \approx \frac{E^2}{8\pi}; \quad E = \frac{Q}{R^2} \Rightarrow W_A \approx \frac{Q^2}{8\pi R^4}$$

$$P = W_A - W_B \approx W_A - 0 \approx W_A$$

Therefore, $P = \frac{Q^2}{8\pi R^4}$
